ABSTRACT

The City Sanitation Plans are strategic planning strategies for the development of the city's sanitation sector. Multiple urban sanitation issues are addressed in the city sanitation plan. Many of these City sanitation plan sanitation issues are linked to population expansion and economic inequity. Increased usage of water and the development of liquid and solid waste are both caused by urbanization, which increases the chance of unhygienic situations. In this study, the urban sanitation issues are identified with respect to the city sanitation plan component. The components of different city sanitation plans are compared based on their best practices and initiatives. From this best practices and initiatives identify suitable sustainable measures with respect to city sanitation plan components. The study is to formulate strategies to Access to toilet CSP components for developing standard framework for addressing urban sanitation issues. Access to adequate toilet space is a crucial practical issue on a daily basis. The toilet has always been considered a basic amenity that human needs. The study's main focus is on access to toilet facilities and analyzing the integration with the surroundings. The public toilet should be about the provision of a safe and convenient public amenity.
