**Addressing Periurban Developments Induced By Information Technology Investment Region:
A Case Of Technocity, Thiruvananthapuram**

Information Technology emerged as an important sector which have a major influence on the economy and functioning of the modern world. The sudden boost in the IT sector resulted in the formation of IT parks all around the world. The infrastructure needed for these developments were provided usually as Greenfield projects in the outskirts of existing cities with excellent connectivity.

Developments in these regions happened without a guidance resulting in a chaos in the adjoining areas and imposed a new load on the major city around which it is situated. Another concern here is the marginalisation and gentrification of the local community. Similar issues can be found in the proposal of Technocity in Pallipuram. A guided growth plan can result in making such developments self-sustained and inclusive. The thesis aims at giving a guided growth proposal to the region around Technocity and also designing the interface between the technocentric developments and the existing local population.
